1939

INTRODUCTION

The Eighth Bulletin of North Carolina Morbidity Statistics, which covers the calendar year 1939, contains tabulations of the same type as those found in previous Bulletins.

A total of 122 cases of endemic typhus fever was reported in 1939. This represents a decided increase over the 81 cases reported the preceding year. These 122 cases occurred in 38 counties, as compared with the 25 counties affected by this disease in 1938. It is felt that this extension of the disease is due to better recognition of the cases that are occurring, as well as to some spread in the means of transmission, the infected rat flea.

In 1939 there was a total of 41 cases of Rocky Mountain spotted fever reported from 21 counties, as compared with 42 cases from 24 counties during the preceding year.

There were 629 cases of malaria reported from 31 counties in 1939, as compared with 636 from 46 counties in 1938.

In 1939 there were 20,031 cases of measles reported as compared with 49,614 cases reported in 1938. Reported cases of whooping cough in 1939 decreased to 9,321 from the total of 14,908 reported in 1938.

Other disease totals decreased in 1939 as compared with the preceding year. Among them were diphtheria with 2,368 cases in 1939 and 2,442 in 1938; pellagra with 214 in 1939 and 816 in 1938; smallpox with 15 in 1939 and 35 in 1938; undulant fever with 25 in 1939 and 29 in 1938; typhoid fever with 343 in 1939 and 485 in 1938; Vincent's infection with 14 in 1939 and 29 in 1938.

There was a considerable increase in reported cases of influenza with 1,544 in 1939 as compared with 498 in 1938. Scarlet fever cases reported in 1939 totaled 2,599 and in 1938 2,228. A decided increase in reported cases of poliomyelitis was recorded, with 116 in 1939 as compared with 50 in 1938. The most pronounced increase recorded this year, however, was in venereal disease case reports. Syphilis cases reported in 1939 reached the highest peak ever recorded in North Carolina with 30,985 cases, as compared with 20,714 in 1938; gonorrhea cases totaled 3,800 in 1939, as compared with 3,029 in 1938; and chancroid case reports increased to 321 in 1939 as compared with 102 in 1938. The vigorous venereal disease control campaign waged in North Carolina is reflected very creditably in these figures, which show the increasing number of venereal disease cases reported in 1939.

In January 1939 a mechanical tabulation system was established in the North Carolina State Board of Health. This necessitated the introduction of new case report forms and other procedures to the physicians of the State. It is believed, however, that considerable benefit will result eventually from this innovation.
